Color Theory

Assume E is the equiluminous point.

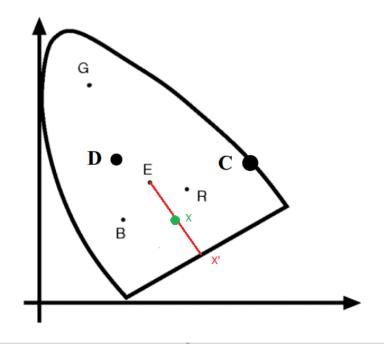

• In the image alongside find the dominant wavelength of color D. Show this wavelength.

A:

The wavelength represented by D' is the dominant wavelength of color D.

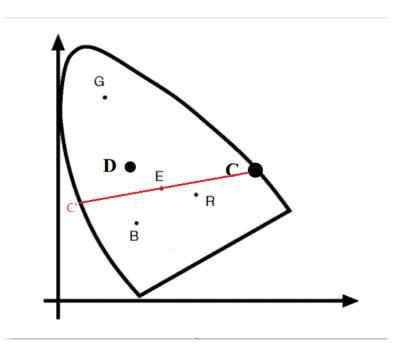

Do all colors have a dominant wavelength? Explain your reasoning.
 A: No.

For color X we know that it can be produced by E and color X'. However, color X' is on the line of purples. That is to say, X' cannot be represented by one wavelength.

• Find the color which is complimentary to the color C and plot its location. What colors in the three dimensional RGB color space map to the equiluminous point E upon projection into the 2D chromaticity space.

A:

C' is complimentary to C'.

E represents the RGB color in which R=G=B.

Generic Compression

• Write down the entropy function and plot it as a function of x.

A:

$$H(x) = -(x^{2}log_{2}x^{2} + (1 - x^{2})log_{2}(1 - x^{2}))$$

- From your plot, for what value of x does the Entropy become a minimum? A: when x = 0 or $x = \pm 1$, the Entropy becomes minimum.
- Although the plot visually gives you the value of x for which the entropy in minimum, can you now mathematically find out the value(s) for which the entropy is a minimum?

A: Let
$$H'^{(x)} = 2x \log_2(1-x^2) - 2x \log_2 x^2 = 0$$
, we have $x = 0$ or $x = 0$

 $\pm \frac{1}{\sqrt{2}}$. Taking these including boundary condition $x = \pm 1$ back to H(x), we know x = 0 or $x = \pm 1$ are minima while $x = \pm \frac{1}{\sqrt{2}}$ are maxima.

• Can you do the same for the maximum, that is can you find out value(s) of x for which the value is a maximum?

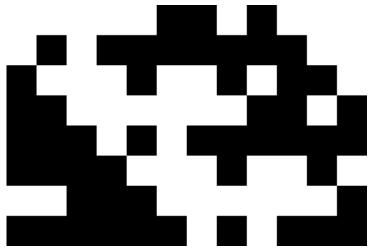

A: As analyzed above, while $x = \pm \frac{1}{\sqrt{2}}$, H(x) has maximum value.

Image Dithering

• Plot the image and make sure that you submit a "zoomed" in image which properly shows all image gray values.

• Compute the output of a dithering operation using the dithering matrix D given below. Assume that the image top left coordinate indexes are [0, 0]. Show a graphical binary image plot of the dithered output.

• What if the image block's top left coordinate indexes start with [1, 1]. Show a graphical binary image plot of the dithered output.
